

SAP Solution Manager | SAP Testing as a Service

# Automate your SAP Testing Process for Greater Efficiency

---

**AUTOMATION**

The increased pace and complexity of modern SAP application delivery is putting tremendous pressure on testing teams to deliver faster, business-focused feedback on the risks associated with new software releases. However, manually testing SAP software is time-consuming and error-prone, and doing SAP regression testing on a large scale for every change is impractical. The only efficient way to effectively keep up with testing requirements is to use an automated testing solution.

### **Testing is More Important than Ever**

Today's businesses typically have a complex infrastructure, with interdependencies between data and systems that require software changes to be thoroughly vetted before being promoted into the production environment. It's all too common that a change in functionality and data in one part of an application can break functionality in another.

Improper or inadequate testing can lead to service disruptions or downtime, which has an impact on the business both internally and externally. Employees become frustrated when the systems they use in their roles are out of service. Even worse, a service disruption provides a less-than-optimal customer experience that could ultimately impact the company's bottom line.

### **Automated SAP Software Testing**

Many organizations are turning to automated testing to protect against potential programming bugs, release incompatibilities and security vulnerabilities. Automation allows you to test changes every time, without having to wait for manual testing or potentially missing something important during the testing process. It's the best solution for the modern, agile IT department.

### **Intelligence SAP Testing as a Service**

The intelligence SAP Testing as a Service solution uses a factory model for end-to-end testing delivered primarily from our global delivery centers located on-shore or off-shore. Our factory model provides support for all test-related activities, including:

- Strategy and design
- Implementation and execution
- Reporting

Intelligence Testing as a Service supports all SAP solutions and test types (Smoke, Functional and Regression). The solution uses SAP Solution Manager Focused Build to perform automated testing for standard SAP processes using Component-Based Test Automation (CBTA).

### Prerequisites

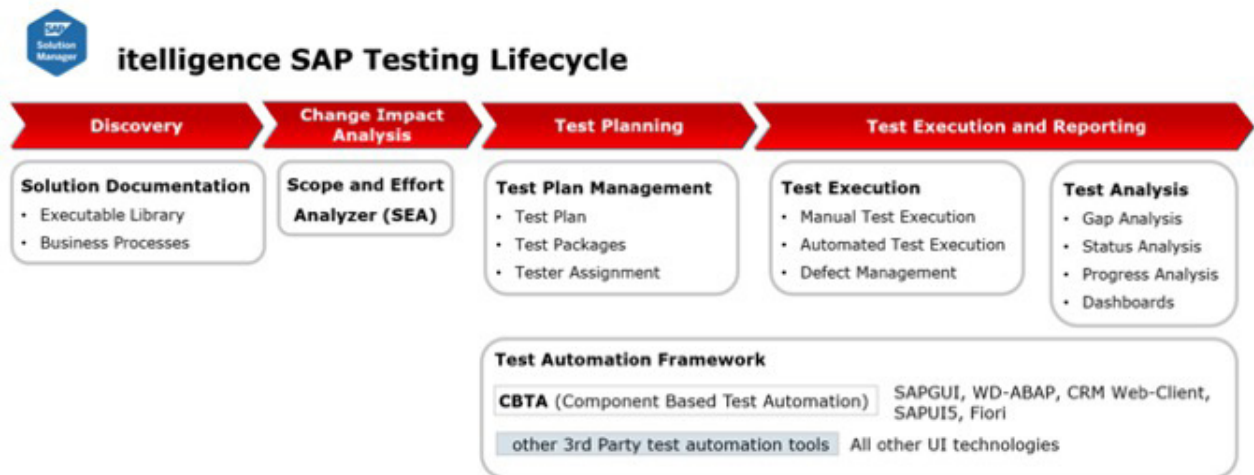

In order to take advantage of SAP Testing as a Service, you must meet the following requirements:

- Be on an active SAP maintenance contract
- Connect to the itelligence Solution Manager as a Managed Service (SMaaS) platform or provide your own Solution Manager for configuration (billable)

### Why itelligence?

In the digital age, you need an IT partner you can rely on. Someone who understands the digital and real-life challenges of your industry and helps you rethink your business. A partner who is with you every step of the way.

With over 30 years' experience, itelligence knows SAP software inside out. We work closely with our clients to identify their specific needs and fulfill them. Numerous SAP awards, certifications and our SAP Platinum Partner status are testament to our success. From consulting to implementation and managed services, we have over 7,900 employees with the expertise to take your business further.
